## SUMMARY

The objective of this article is to document the names of histamine-forming bacteria (HFB) found in foods and available from the scientific literature. This extensive compilation found 148 unique species of HFB identified, representing 57 genera, 25 families, 13 orders, 6 classes, and 3 phyla. A synonymous species name was recorded in many cases, so both species names have been recorded in this article. Based on the findings, there were 78 species of Gram-negative and 70 species of Gram-positive HFB, with 18 spore-forming species. The food matrix, or type of food from which the bacteria were identified, also is provided, and the most common food matrix identified in this listing was fish based. The genera with the most HFB species were *Bacillus* (14), *Lactobacillus* (11), and *Staphylococcus* (8). The families with the most genera were *Lactobacillaceae* (31), *Enterobacteriaceae* (29), and *Vibrionaceae* (17). A list of published HFB, publication authors, and corresponding document DOI numbers is included. This compilation with DOI numbers should be useful to other researchers searching for HFB with certain characteristics.

## INTRODUCTION

The objective of this article is to document histamine-forming bacteria (HFB) that have been cited in published literature and are present in human foods. The effort and study objectives resulted from various investigations over the years that the authors have been involved in, looking for HFB with particular characteristics. This initial effort found no single database of HFB and characteristics in human food, so a comprehensive list of HFB was compiled.

Histamine can be formed in certain bacteria by the enzyme histidine decarboxylase (HDC) if free molecules of the amino acid L-histidine are present. HDC is uniquely able to remove a carbon dioxide molecule from the L-histidine molecule to form histamine (51), and either of two pathways are used, depending on whether the bacteria are Gram-positive or Gram-negative. The Gram-positive bacteria use a pyruvoyl residue that is covalently bound at

the active site, whereas pyridoxal phosphate-dependent enzymes are used in Gram-negative bacteria (25). The bacteria gain a proton of energy and pH control from this decarboxylase reaction (34, 35). Previous authors provide a clear explanation and schematic of the cellular process to produce histamine in the bacteria (17, 30, 35). This process includes the proton motive force generated by the decarboxylation and electrogenic antiporter mechanism of transporting the L-histidine molecule into the bacterial cell, the ensuing decarboxylation reaction, and the histamine molecule that is produced and then transported or exported out of the cell. A generalized scheme is presented by Molenaar et al. (34).

The histidine → histamine reaction requires free L-histidine molecules to be available in the food matrix for the HFB to process. This histidine molecule is provided by either the naturally occurring free L-histidine in muscle tissues or the food matrix. The free L-histidine also is available during fermentation when proteins are broken down (proteolysis) into their free amino acids (41). For example, free L-histidine is naturally available in the muscle tissue of scombroid and other fast-moving fish. Large amounts of free L-histidine in these fish act as a buffer during fight-or-flight muscle movement (9). However, other sources of free amino acids, such as histidine, are generated during the fermentation of foods such as kimchi, miso, cheese, sausage, wine, beer, and fermented fishery products. In virtually all foods containing proteins and experiencing the conditions that enable microbial fermentation activity, histamine formation can be expected if HFB are present. The total amount of the histamine formed strongly depends on the nature of the food, types of bacteria present, and incubation temperature (30).

Histamine is the only biogenic amine that is regulated for food safety (60), and it is only regulated for fish, primarily scombroid fish (19). The allowable sets of limits for histamine content in fish varies in different countries. For example, the levels of histamine allowed in fish in the United States differ from those in the European Union (12).

**TABLE 1. Species or genera (unique) that are Gram-positive or Gram-negative, their oxygen requirements, and their spore-forming ability**

Gram-positive or Gram-negative	Spores	Environment	Count	Subtotal	Total
Positive	Endospore	Aerobic	2		
		Anaerobic	2		
		Facultative anaerobic	14	18	
	No	Aerobic	2		
		Aerotolerant	11		
		Anaerobic	3		
		Facultative anaerobic	32		
		Microaerophile	2		
		Unknown	2	52	70
Negative	No	Aerobic	15		
		Facultative aerobic	3		
		Facultative anaerobic	60	78	78
<b>Total unique bacterial names</b>				<b>148</b>	

A list of histamine-secreting bacteria in the human gut microbiome has been developed based on genomic analyses (35). Although the lists may overlap, this article focuses on HFB in human foods.

## METHODS

An extensive literature search of the electronic media using Google Scholar and other search engines was conducted using terms such as HFB, tuna, scombroid fish poisoning, cheese, sausage, fermented foods, sauerkraut, spinach, fermented fish, and wine. The HFB species were recorded and then identified as to genus, family, order, class, and phylum. Characteristics such as whether the species is Gram-positive or Gram-negative, whether it is a spore former, and its preferred level of oxygen in the environment also were noted. The data were recorded in Microsoft Excel tables and summarized using pivot tables. The species, genera, and some characteristics were verified with the website BacDive (2).

Not every published paper that mentions HFB can be cited or mentioned here; however, when a species new to the list being developed was found, the entire list of HFB from that paper was included in the dataset, along with all characteristics of that species or group. Some HFB activity in foods was only identified to the genus or family level, and genera or families were included in the master list as well. Several HFB species were listed in only one source and were not identified in BacDive (2), so some characteristics were labeled as unknown.

## RESULTS

In total, 182 species of bacteria, genus, or family names were identified as HFB present in human foods and are listed in *Appendix A*. Bacterial names are updated periodically, and current correct names and synonyms have been previously documented and collated in BacDive (2). There are four types of listing for the HFB in this article: the correct species names and synonyms; synonyms only; one unique genus; and one unique family. The unique species, genera, and families are identified in *Appendix A*, as well as characteristics such as Gram-positive or Gram-negative, oxygen requirements, and the ability to form spores. Of the 148 unique names of species and/or genera, there were 70 Gram-positive and 78 Gram-negative species (*Table 1*). The Gram-positive group contained 18 species that can form spores under certain conditions. The 148 HFB species were part of 57 genera, 25 families, 13 orders, 6 classes, and just 3 phyla (*Table 2*). For comparison it is estimated that there are at least 65 known bacterial phyla (47).

It's important to understand the environment (oxygen requirements) for these HFB. For example, *Tetragenococcus* spp. are capable of growing in anaerobic environments, like unretorted canned anchovies (4) (DeBeer, J., personal communication). Many *Bacillus* spp. can form spores that withstand harsh dry environments, like dried fishmeal (23). This is not a complete list, but the compilation hopefully can help future researchers understand why they suddenly find an unfamiliar species in food (46).

Overall total			16	16	307	
					393	

This article does not list, quantify, or compare the histamine formation of the HFB, because this ability is not often detailed in the published literature. In addition, individual species are not identified as psychrophilic, mesophilic, or thermophilic, because bacterial serovars of some species can assume more than one of these three conditions. For example, *Weissella paramesenteroides*, a known HFB, is identified as being psychrophilic, mesophilic, or thermophilic, depending on the strain involved (2).

All of these HFB include a notation that the species name was correct for mid-2024 or identified in the literature as a synonym name (*Appendix A*). Multiple species were found that were identified with different names (synonyms) by different authors at different periods. These HFB are listed as synonyms in *Appendix A*. The number of species with synonyms identified in a search of the available literature was 35. *Appendix B* lists the HFB with the authors and DOI numbers of the source documentation.

HFB were identified in a multitude of food matrices. *Table 3* is divided into 3 sections: environment, food types, and food matrices. The food matrices within the seafood type had by far the most citations of HFB, with 291 mentions by all bacterial species or genera recorded. Fermented foods, including fermented seafood, were cited

in association with 98 bacterial species or genera. Many citations are expected to be duplicates, but an order of magnitude is provided for the sources of HFB within food matrices and/or types. The phyla, classes, orders, families, and genera of the unique HFB are listed in *Table 4*.

## DISCUSSION

About 30,000 formally named bacterial species have been cultured, but there are likely a million to a billion unnamed species (15). Curtis et al. (11) estimate that there are 2 million bacterial taxa in the sea. As can be readily seen by what has been provided in this compilation, the number of HFB, with fewer than 150 named species, is a tiny percentage of the total number of bacterial species.

In this compilation of HFB, the genera with the highest numbers of unique species were *Bacillus* (14), *Lactobacillus* (11), and *Staphylococcus* (8). The families with the highest numbers of genera were *Lactobacillaceae* (31), *Enterobacteriaceae* (29), and *Vibrionaceae* (17). The orders with the most reported HFB species were *Enterobacterales* (44), *Lactobacillales* (39), *Bacillales* (27) and *Vibrionales* (17).

In conclusion, the authors hope this compilation of HFB is useful to future researchers when they are studying an unknown source of histamine. Both authors have had occasions in the past in which they could have used this list.

#### ACKNOWLEDGMENTS

Each author has worked for U.S. tuna processing companies over the last 30–40 years in various roles, such as procurement, fisheries development, operations, and quality assurance. Each of them has spent many hours in the field working with fishermen and boat owners to try to

prevent histamine growth and maintain seafood freshness in their catches. The authors thank Deborah Mona Baumgartel for her editorial assistance. The authors declare no conflict of interest, financial or otherwise. No external funds were received for this study. A spreadsheet with the listing of HFB names can be obtained from the corresponding author.

**APPENDIX A. Histamine-forming bacteria found in the literature that are Gram-positive or Gram-negative, their oxygen requirements, and their spore-forming ability**

Bacterial species named in text	Taxonomic status	Correct or alternate name	Unique	Gram-positive or Gram-negative	Environment	Spores
<i>Acinetobacter baumannii</i>	Correct		Unique	Negative	Aerobic	No
<i>Acinetobacter lwoffii</i>	Correct		Unique	Negative	Aerobic	No
<i>Actinobacillus ureae</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Aeromonas hydrophila</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Aeromonas salmonicida</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Aeromonas sobria</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Aeromonas</i> spp.	Genus only			Negative	Facultative anaerobic	No
<i>Alcaligenes faecalis</i>	Correct		Unique	Negative	Aerobic	No
<i>Alteromonas putrefaciens</i>	Synonym	<i>Shewanella putrefaciens</i>		Negative	Facultative anaerobic	No
<i>Bacillus amyloliquefaciens</i>	Correct		Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus cibi</i>	Synonym	<i>Metabacillus indicus</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus coagulans</i>	Synonym	<i>Heyndrickxia coagulans</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus firmus</i>	Synonym	<i>Cytobacillus firmus</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus flexus</i>	Synonym	<i>Priestia flexa</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus licheniformis</i>	Correct		Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus macerans</i>	Synonym	<i>Paenibacillus macerans</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus malacitensis</i>	Synonym	<i>Bacillus halotolerans</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus massiliensis</i>	Synonym	<i>Ureibacillus massiliensis</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus megaterium</i>	Synonym	<i>Priestia megaterium</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus oleronius</i>	Synonym	<i>Heyndrickxia oleronia</i>	Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus polyfermenticus</i>	Preferred name		Unique	Positive	Facultative anaerobic	Endospore
<i>Bacillus</i> spp.	Genus only			Positive	Facultative anaerobic	Endospore
<i>Bacillus subtilis</i>	Correct		Unique	Positive	Facultative anaerobic	Endospore

**APPENDIX A. Histamine-forming bacteria found in the literature that are Gram-positive or Gram-negative, their oxygen requirements, and their spore-forming ability (cont.)**

Bacterial species named in text	Taxonomic status	Correct or alternate name	Unique	Gram-positive or Gram-negative	Environment	Spores
<i>Bacillus thuringiensis</i>	Correct		Unique	Positive	Facultative anaerobic	Endospore
<i>Brevibacillus brevis</i>	Correct		Unique	Positive	Aerobic	Endospore
<i>Brevibacterium casei</i>	Correct		Unique	Positive	Aerobic	No
<i>Citrobacter amalonaticus</i>	Correct		Unique	Negative	Aerobic	No
<i>Citrobacter braakii</i>	Correct		Unique	Negative	Aerobic	No
<i>Citrobacter farmeri</i>	Correct		Unique	Negative	Aerobic	No
<i>Citrobacter freundii</i>	Correct		Unique	Negative	Aerobic	No
<i>Citrobacter koseri</i>	Correct		Unique	Negative	Aerobic	No
<i>Citrobacter spp.</i>	Genus only			Negative	Aerobic	No
<i>Clostridium irregular</i>	Synonym	<i>Asaccharospora irregularis</i>	Unique	Positive	Anaerobic	Endospore
<i>Clostridium perfringens</i>	Correct		Unique	Positive	Anaerobic	Endospore
<i>Clostridium spp.</i>	Genus only			Positive	Anaerobic	Endospore
<i>Cronobacter sakazakii</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Edwardsiella hoshinae</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Enterobacter aerogenes</i>	Synonym	<i>Klebsiella aerogenes</i>		Negative	Facultative anaerobic	No
<i>Enterobacter amnigenus</i>	Synonym	<i>Lelliottia amnigena</i>	Unique	Negative	Facultative anaerobic	No
<i>Enterobacter cloacae</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Enterobacter gergoviae</i>	Synonym	<i>Pluralibacter gergoviae</i>	Unique	Negative	Facultative anaerobic	No
<i>Enterobacter hormaechei</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Enterobacter spp.</i>	Genus only			Negative	Facultative anaerobic	No
<i>Enterobacter taylorae</i>	Synonym	<i>Enterobacter cancerogenus</i>	Unique	Negative	Facultative anaerobic	No
<i>Enterobacter xianfengensis</i>	No BacDive		Unique	Negative	Facultative anaerobic	No
<i>Enterobacteriaceae</i>	Family			Negative	NA <sup>a</sup>	NA
<i>Enterococcus casseliflavus</i>	Correct		Unique	Positive	Facultative anaerobic	No
<i>Enterococcus faecalis</i>	Correct		Unique	Positive	Facultative anaerobic	No
<i>Erwinia persicina</i>	Correct		Unique	Negative	Facultative anaerobic	No

Table continued on the next page.

**APPENDIX A. Histamine-forming bacteria found in the literature that are Gram-positive or Gram-negative, their oxygen requirements, and their spore-forming ability (cont.)**

Bacterial species named in text	Taxonomic status	Correct or alternate name	Unique	Gram-positive or Gram-negative	Environment	Spores
<i>Escherichia coli</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Escherichia hermannii</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Hafnia alvei</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Hafnia paralvei</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Klebsiella aerogenes</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Klebsiella oxytoca</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Klebsiella pneumoniae</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Klebsiella pneumoniae</i> subsp. <i>pneumoniae</i>	Subsp.			Negative	Facultative anaerobic	No
<i>Klebsiella</i> spp.	Genus only			Negative	Facultative anaerobic	No
<i>Klebsiella variicola</i>	Correct		Unique	Negative	Facultative anaerobic	No
<i>Lacticaseibacillus casei</i>	Correct		Unique	Positive	Anaerobic	No
<i>Lacticaseibacillus paracasei</i>	Correct		Unique	Positive	Anaerobic	No
<i>Lactiplantibacillus plantarum</i>	Correct		Unique	Positive	Facultative anaerobic	No
<i>Lactobacillus bavaricus</i>	Synonym	<i>Latilactobacillus sakei</i>		Positive	Aerotolerant	No
<i>Lactobacillus brevis</i>	Synonym	<i>Levilactobacillus brevis</i>		Positive	Aerotolerant	No
<i>Lactobacillus buchneri</i>	Synonym	<i>Lenticolactobacillus buchneri</i>	Unique	Positive	Aerotolerant	No
<i>Lactobacillus curvatus</i>	Synonym	<i>Latilactobacillus curvatus</i>		Positive	Aerotolerant	No
